Best Practices for Prototypes

When you create your prototype, choose the tool that works best for you and focus on simplicity. The goal is not to create a working product but to simulate a product experience just enough to get real feedback and learn quickly. As you work on your prototype, consider the following recommended elements. You can use this worksheet to guide your efforts. What input can the user provide (text inputs, dropdowns, date selectors, etc.)?

Considerations:

Does each screen have a visual as recommended?

Notes for Changes/Additions:

Which of the following pages are included?

- ☐ Homepage
- ☐ Category page, for clothing, shoes, accessories, and future categories
- ☐ Product details page, for full information on one product
- ☐ Shopping cart page for checkout

Notes for Changes/Additions:

Is the design flexible and scalable as recommended?

Notes for Changes/Additions:

Do the content and components of each page reflect good design principles?

Notes for Changes/Additions:

What content (video, images, text) do you present to the user?

Notes for Changes/Additions:

What input can the user provide (text inputs, dropdowns, date selectors, etc.)?

Notes for Changes/Additions:

What actions can the user take?

Notes for Changes/Additions:

What actions will take you away from this screen to a new screen? For example, “Checkout” link takes you to the shopping cart page.

Notes for Changes/Additions:

Focus carefully on the goal of each page. What do you want the user to accomplish? Provide the most succinct content you need to accomplish that. Eliminate everything else.

Notes for Changes/Additions:

Remember that for prototypes, you don't need real videos, the best images, or final content. You can insert icons to show where a product video will be.

Notes for Changes/Additions:

Is the prototype interactive? (Is it clickable?) Does it simulate a product experience?

Notes for Changes/Additions:
