

TOOL

Create a Backlog

Use this worksheet to guide you through the process of creating a backlog.

Instructions:

1. Select your scenario of choice: Virtual assistant **or** your own product idea
2. Create at least 10 potential tickets, each one being an individual unit of work. For each ticket:
 - Estimate the size: Keep it very simple with a scale of 1 (Small), 2 (Medium), and 3 (Large). If a ticket feels too big, break it into smaller pieces.
 - Write notes that describe the individual components of work required to complete the ticket. These notes should be very specific.
3. Think about all the areas of your application: login and account setup, user preferences, machine learning and algorithms, iOS and Android permission requests (location, camera, contacts, etc.), retrieving information from outside sources, push notifications, and anything that is relevant to your product.
4. Use your Objectives and Key Results as a guide.
5. Look again to see if any tickets should be broken down into multiple units of work.
6. An example is listed below to help you get started.

Example: Virtual Assistant

Ticket: Integrate with Google Calendar

Size: 2

Notes:

- Create an interaction in the app for a user to add their Google Calendar so the virtual assistant will know the user's schedule
- Integrate with Google's authentication to access a user's calendar and events
- Retrieve and ingest all of the user's calendar events
- Does not include the scope of interpreting the calendar events or doing anything with them, this ticket just handles permissions, integration, and retrieving them
